DIVISIONS OF TIME.

A SOLAR DAY is measured by the rotation of the earth upon its axis, and is of different lengths, owing to the ellipticity of the earth's orbit and other causes; but a mean solar day, recorded by the time-piece, is twenty-four hours long.

AN ASTRONOMICAL DAY commences at noon, and is counted from the first to the twenty-fourth hour. A CIVIL DAY commences at midnight, and is counted from the first to the twelfth hour, when it is recounted again from the first to the twelfth hour. A NAUTICAL DAY is counted as a Civil Day, but commences, like an Astronomical Day, from noon.

A CALENDAR MONTH varies in length from 28 to 31 days. A MEAN LUNAR MONTH is 29 days, 12 hours, 44 minutes, 2 seconds, and 5.24 thirds.

A YEAR is divided into 365 days.

A SOLAR YEAR, which is the time occupied by the Sun in passing from one Vernal Equinox to another, consists of 365.2424 solar days, or 365 days, 5 hours, 48 minutes, and 49.536 seconds.

A JULIAN YEAR is 365 days. A GREGORIAN YEAR is 365.2425 days. Every fourth year is BISSEXTILE, or LEAP YEAR, and is 366 days. The error of the Gregorian computation amounts only to one day in 3571.4286 years.

TO ASCERTAIN THE LENGTH OF THE DAY AND NIGHT.

At any time of the year add 12 hours to the time of the sun's setting, and from the sum subtract the time of rising for the length of the day. Subtract the time of setting from 12 hours, and to the remainder add the time of rising next morning for the length of the night. These rules are equally true for apparent time.

IMPORTANT EPOCHS AND ERAS.

Destruction of Troy.....June, B. C. 1184.
Building of Solomon's Temple.....May, B. C. 1015.
Roman Era.....April 24, B. C. 753.
Christian Era.....January 1, A. D. 1; A. M. 4004.
Destruction of Jerusalem.....September 21, A. D. 69.
Conquest of England.....October 14, A. D. 1066.
Declaration of American Independence.....July 4, A. D. 1776.

THINGS WORTH KNOWING.

SOUND travels at the rate of 1142 feet per second in the air, 4960 in water, 11,000 in cast-iron, 17,000 in steel, 18,000 in glass, and from 4636 to 17,000 in wood.

Mercury freezes at 38 degrees below zero Fahrenheit, and becomes a solid mass, malleable under the hammer.

The greatest height at which visible clouds ever exist does not exceed ten miles.

Air is about 816 times lighter than common water.

The pressure of the atmosphere upon every square foot of the earth amounts to 2160 lbs. An ordinary sized man, supposing his surface to be 14 square feet, sustains the enormous pressure of 30,340 lbs.

Heat rarefies air to such an extent that it can be made to occupy 5500 times the space it did before.

The violence of the expansion of water when freezing is sufficient to cleave a globe of copper of such thickness as to require a force of 28,000 lbs. to produce a like effect.

During the conversion of ice into water, 140 degrees' of heat are absorbed.

Water, when converted into steam, increases in bulk 18,000 times.

One hundred pounds of Dead Sea water contains 46 lbs. of salt.

The mean annual depth of rain that falls at the equator is 96 inches.

Assuming the temperature of the interior of the earth to increase uniformly at the rate of one degree for every 45 feet, at the depth of 60 miles the degree of heat would be sufficient to fuse all known substances.

The explosive force of close-confined gunpowder is six and a half tons to the square inch.

The greatest artificial cold ever produced is 91 degrees below zero Fahrenheit.

Water obstructs one-half of the perpendicular rays of the sun in 17 feet, and three-fourths in 34 feet; and less than one-thousandth part reaches the depth of 200 feet; hence the bottom of deep waters is in total darkness.

The Sun has a diameter of 885,680 miles, and its bulk is 1,400,000 times greater than that of the Earth.

The Earth moves forward in its orbit, 1,640,000 miles per day, 68,000 miles per hour, 1,100 miles per minute, and nearly 19 miles every second. Its diameter is 7912 miles, and its distance from the Sun 92,000,000 miles. The Moon's diameter is 2160 miles, and its volume one forty-ninth of that of the Earth. It revolves in its orbit once in 29½ days, at a distance of 240,000 miles from the Earth.
