

WHITE FIVE PASSENGER SIX
Electrically Self-Started and Lighted

THE WHITE SIX

Electrically Started and Lighted — Left Side Drive

The purchaser of a high-priced car has the right to expect superior design and equipment as well as superior material and workmanship.

The White was the first Six to introduce left-side drive, and today presents this logical method of control in its most desirable form—with right-hand operation of the gear-lever.

The White was the first Six to incorporate in its equipment an electrical starting and lighting system. The White Electrical System is designed and built by The White Company, in The White Factory, especially for White Cars. The White is the only Six today equipped with an electrical system that is manufactured by an automobile company especially for its own product.
